

MICRO-SEGMENTATION: THE PATH TO SUCCESS WITH GUARDICORE

HOW LONG DOES IT TAKE TO SEGMENT A SINGLE BUSINESS CRITICAL APPLICATION?

Step	The VLAN Route	The Guardicore Route
1 Preparation	4-6 months are required to prepare networking and application changes. Networking teams need to prepare the network for new VLANs, configure switches and connect servers. Application teams need to prepare a migration strategy: discover all relevant infrastructure, adapt application code for target VLANs, and prepare dependent applications for the change.	A few days are required for agent deployment and correct labeling. Deploy Guardicore agents on the application, with a simple installation which works on any legacy or modern platform. The application servers are labeled by integrating with an organizational inventory, such as CMDB or cloud tags. Easily use Reveal to discover the application's true footprint.
2 Policy creation and tuning	2-4 months are required to submit firewall change requests, submit fixes, approve and sign them off by firewall governance teams.	2 weeks are required to get to an initial, automatic policy suggestion from Centra, run it in "alert" mode and fine tune it to meet all connectivity requirements.
3 Policy enforcement	1 weekend & application downtime are required to migrate the application to the new VLAN, reconfigure IP addresses, applications and integration points.	1 day is required to move to "enforce" mode.
Overall Time Required	6-10 months Requires application downtime	Less than 1 month No application downtime
